

Cushion Tire Forklift Attachment

Cushion Tire Forklift Attachment - Cushion tires are a firm tire with a smooth profile. Its' tread is attached to a steel ring so as to shape the tire, and the tire is pressed onto a hub which is connected to the forklift. These tires are perfect to use in smooth floor warehouses and are accessible in several polyurethane or rubber compounds.

A poly tire has polyurethane rather than rubber and is likewise a solid tire. They are used rather than cushion tires for such applications which require a higher tire load capacity or a lower steering effort than could be obtained using the cushion tire. Poly tires come in in a variety of hardness ratings to meet various specific application needs. Orderpicker lift trucks and Narrow Aisle models will typically make use of small diameter poly tires for their outrigger load wheels.
