

## Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that could allow the the one driving to operate the lift truck without leaving the seat. They are made out of high quality materials and are designed to withstand the most challenging procedures and work surroundings. Side shifting units have the added ability to laterally position the arms or the entire load in order to facilitate much more precise carrying and placement in a faster and much more efficient way.

The unique blade pocket design enables the person operating it to securely sway the unit's forks without any worry of destroying the positioning cylinders. This allows the worker the alternative to either perform simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into fork positioners on existing units.
